2.Objectives

- Build an interactive device for learning Bangla Braille.
- Let users learn Bangla Braille by using vibration and audio feedback.
- Let users practice Braille using push buttons.
- Use AI to adapt learning based on user performance.
- Keep the system low-cost and user friendly.

3.Literature Review

Hardware-Based Braille Learning Systems

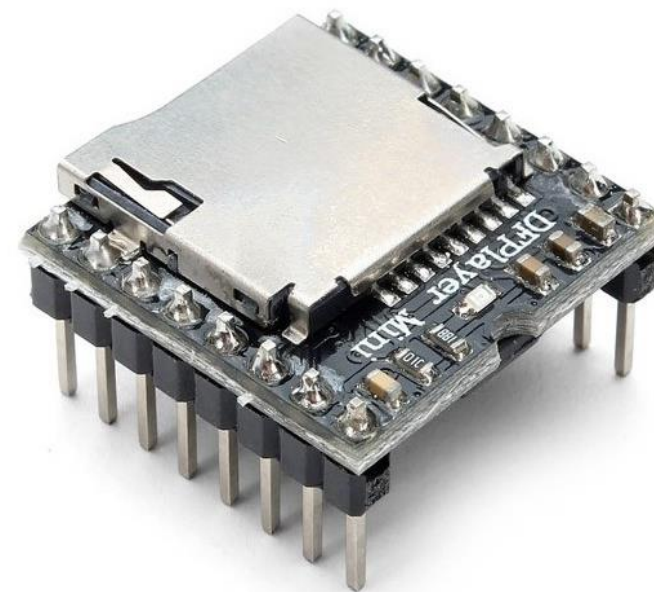

Paper	Main Work	Research Gap for Our Project
Kader et al. (2018) Developing A Self-Learning Braille Kit for Visually Impaired People	Built a self learning Bengali Braille kit using six actuators and audio. It supports learning mode and practice mode.	Costly and it does not include ML/AI based implementation.
Saikot & Sanim (2022) Refreshable Braille Display With Adjustable Cell Size for Learners With Different Tactile Sensitivity	Developed a singlecell refreshable Braille display with six electromechanical actuators, adjustable dot spacing, and speech support.	Expensive.It does not have practice mode.It doesn't include ML/AI based implementation as well.
Ma, Lai & Luo (2025) BrailleRhythm: Enhancing Braille Character Recognition and Learning via Real-time Tactile Sensing and Audio Feedback	Placed a pressure-sensor sheet over Braille cards. The system detects touched Braille patterns and gives real-time audio feedback.	It is not Bangla focused and does not test learner answers, retries, or adaptive teaching actions.

4.Methodology

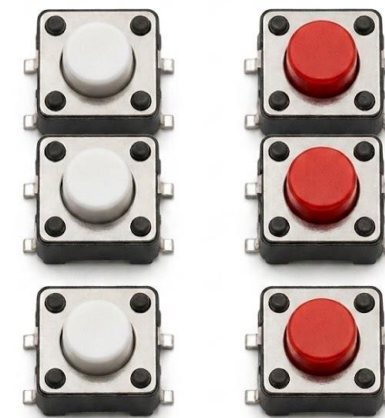

Hardware Architecture

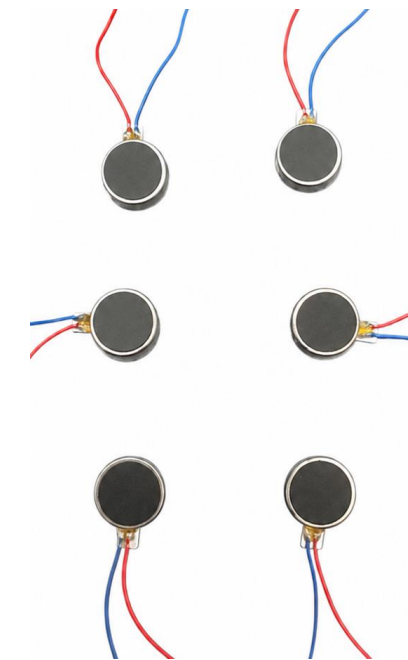

**ESP32 Dev Kit
(MCU)**

**DFPlayer Mini
(Audio Feedback)**

**Tactile Push Buttons
(User Braille Input)**

**1030 Coin Vibration Motor
(Haptic Feedback)**

Methodology

Haptic Teaching Module

Haptic Teaching Module:

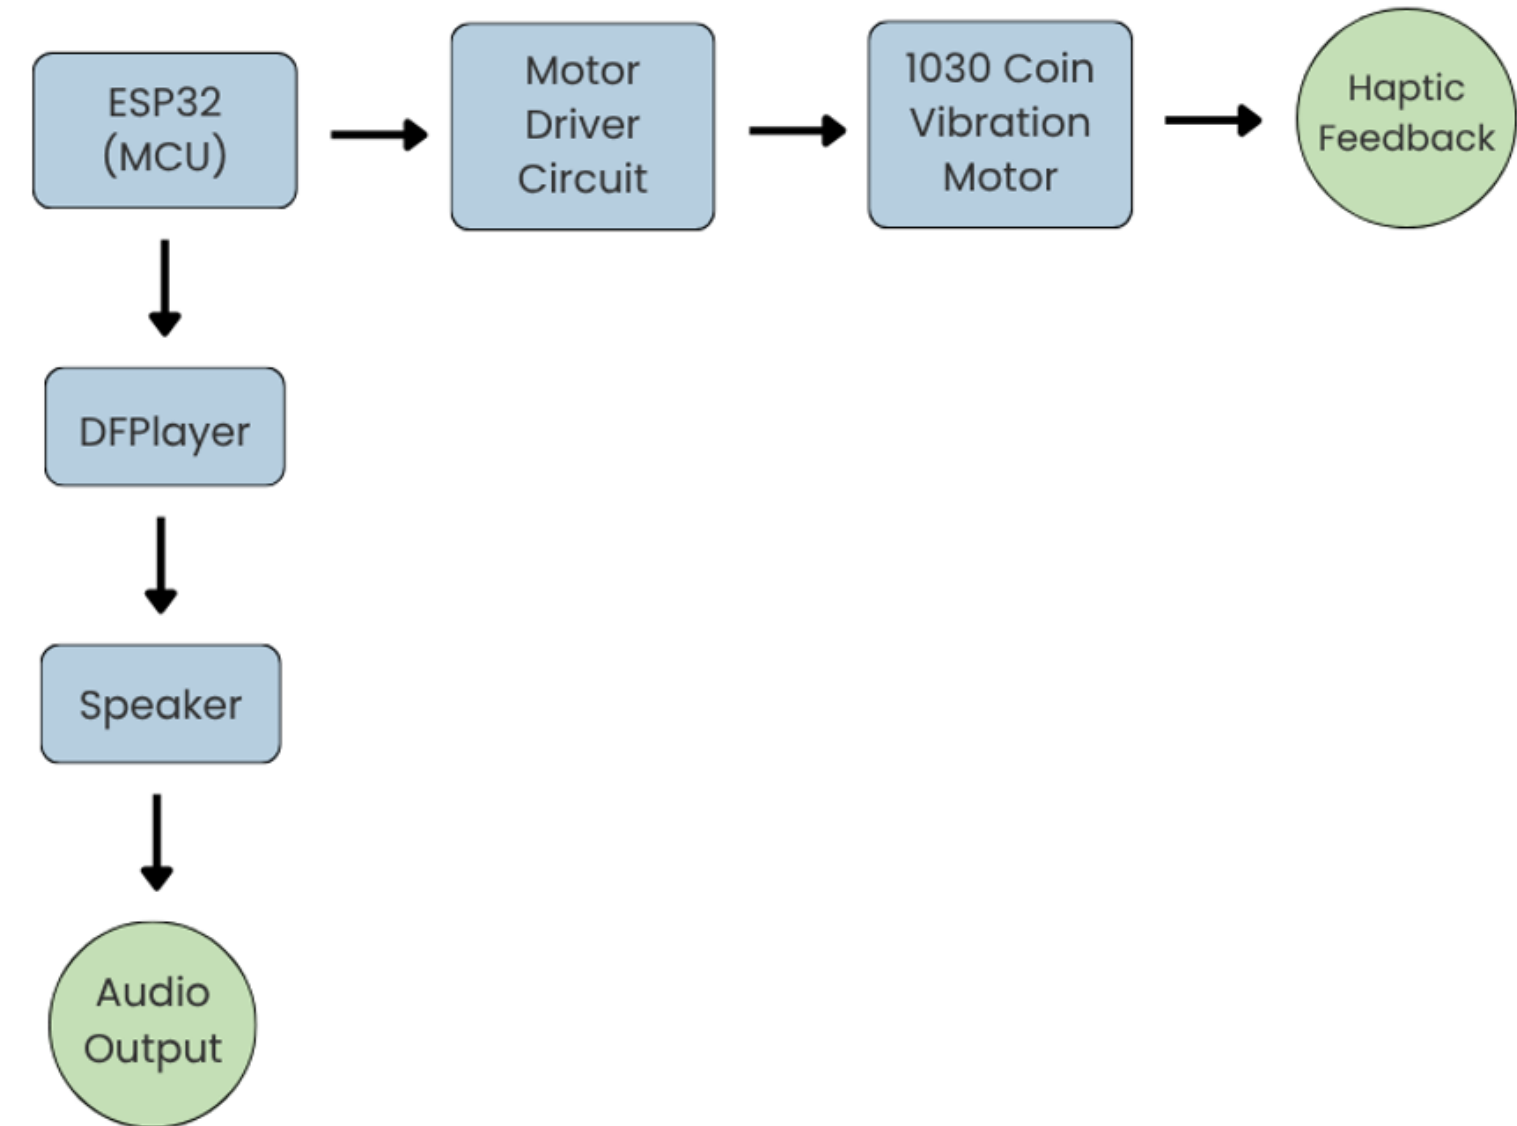

This module teaches Bangla Braille using both audio and vibration, so the learner can hear the letter and feel its Braille pattern.

Auditory Pathway:

The ESP32 selects a letter and sends a command to the DFPlayer, which plays the corresponding Bangla audio through the speaker.

Haptic Pathway:

At the same time, the ESP32 controls the motor driver to activate the required combination of six vibration motors, creating the Braille pattern as haptic feedback.

Methodology

Interactive Evaluation Module

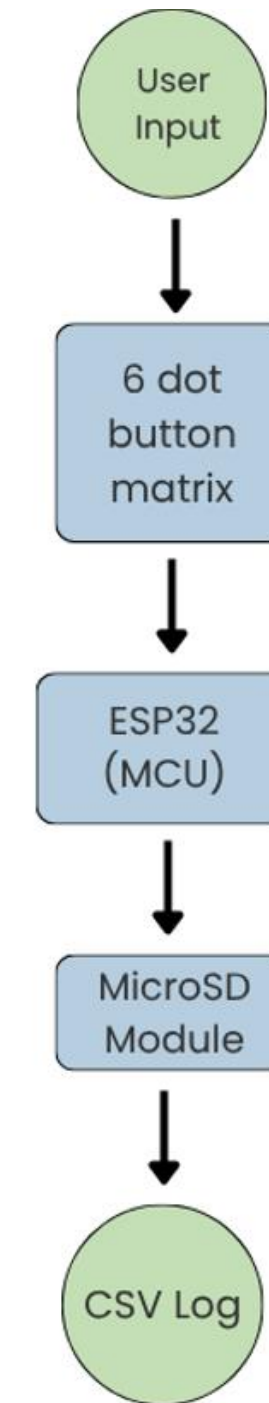

Real-Time Input & Assessment

i. Tactile Input Pathway:

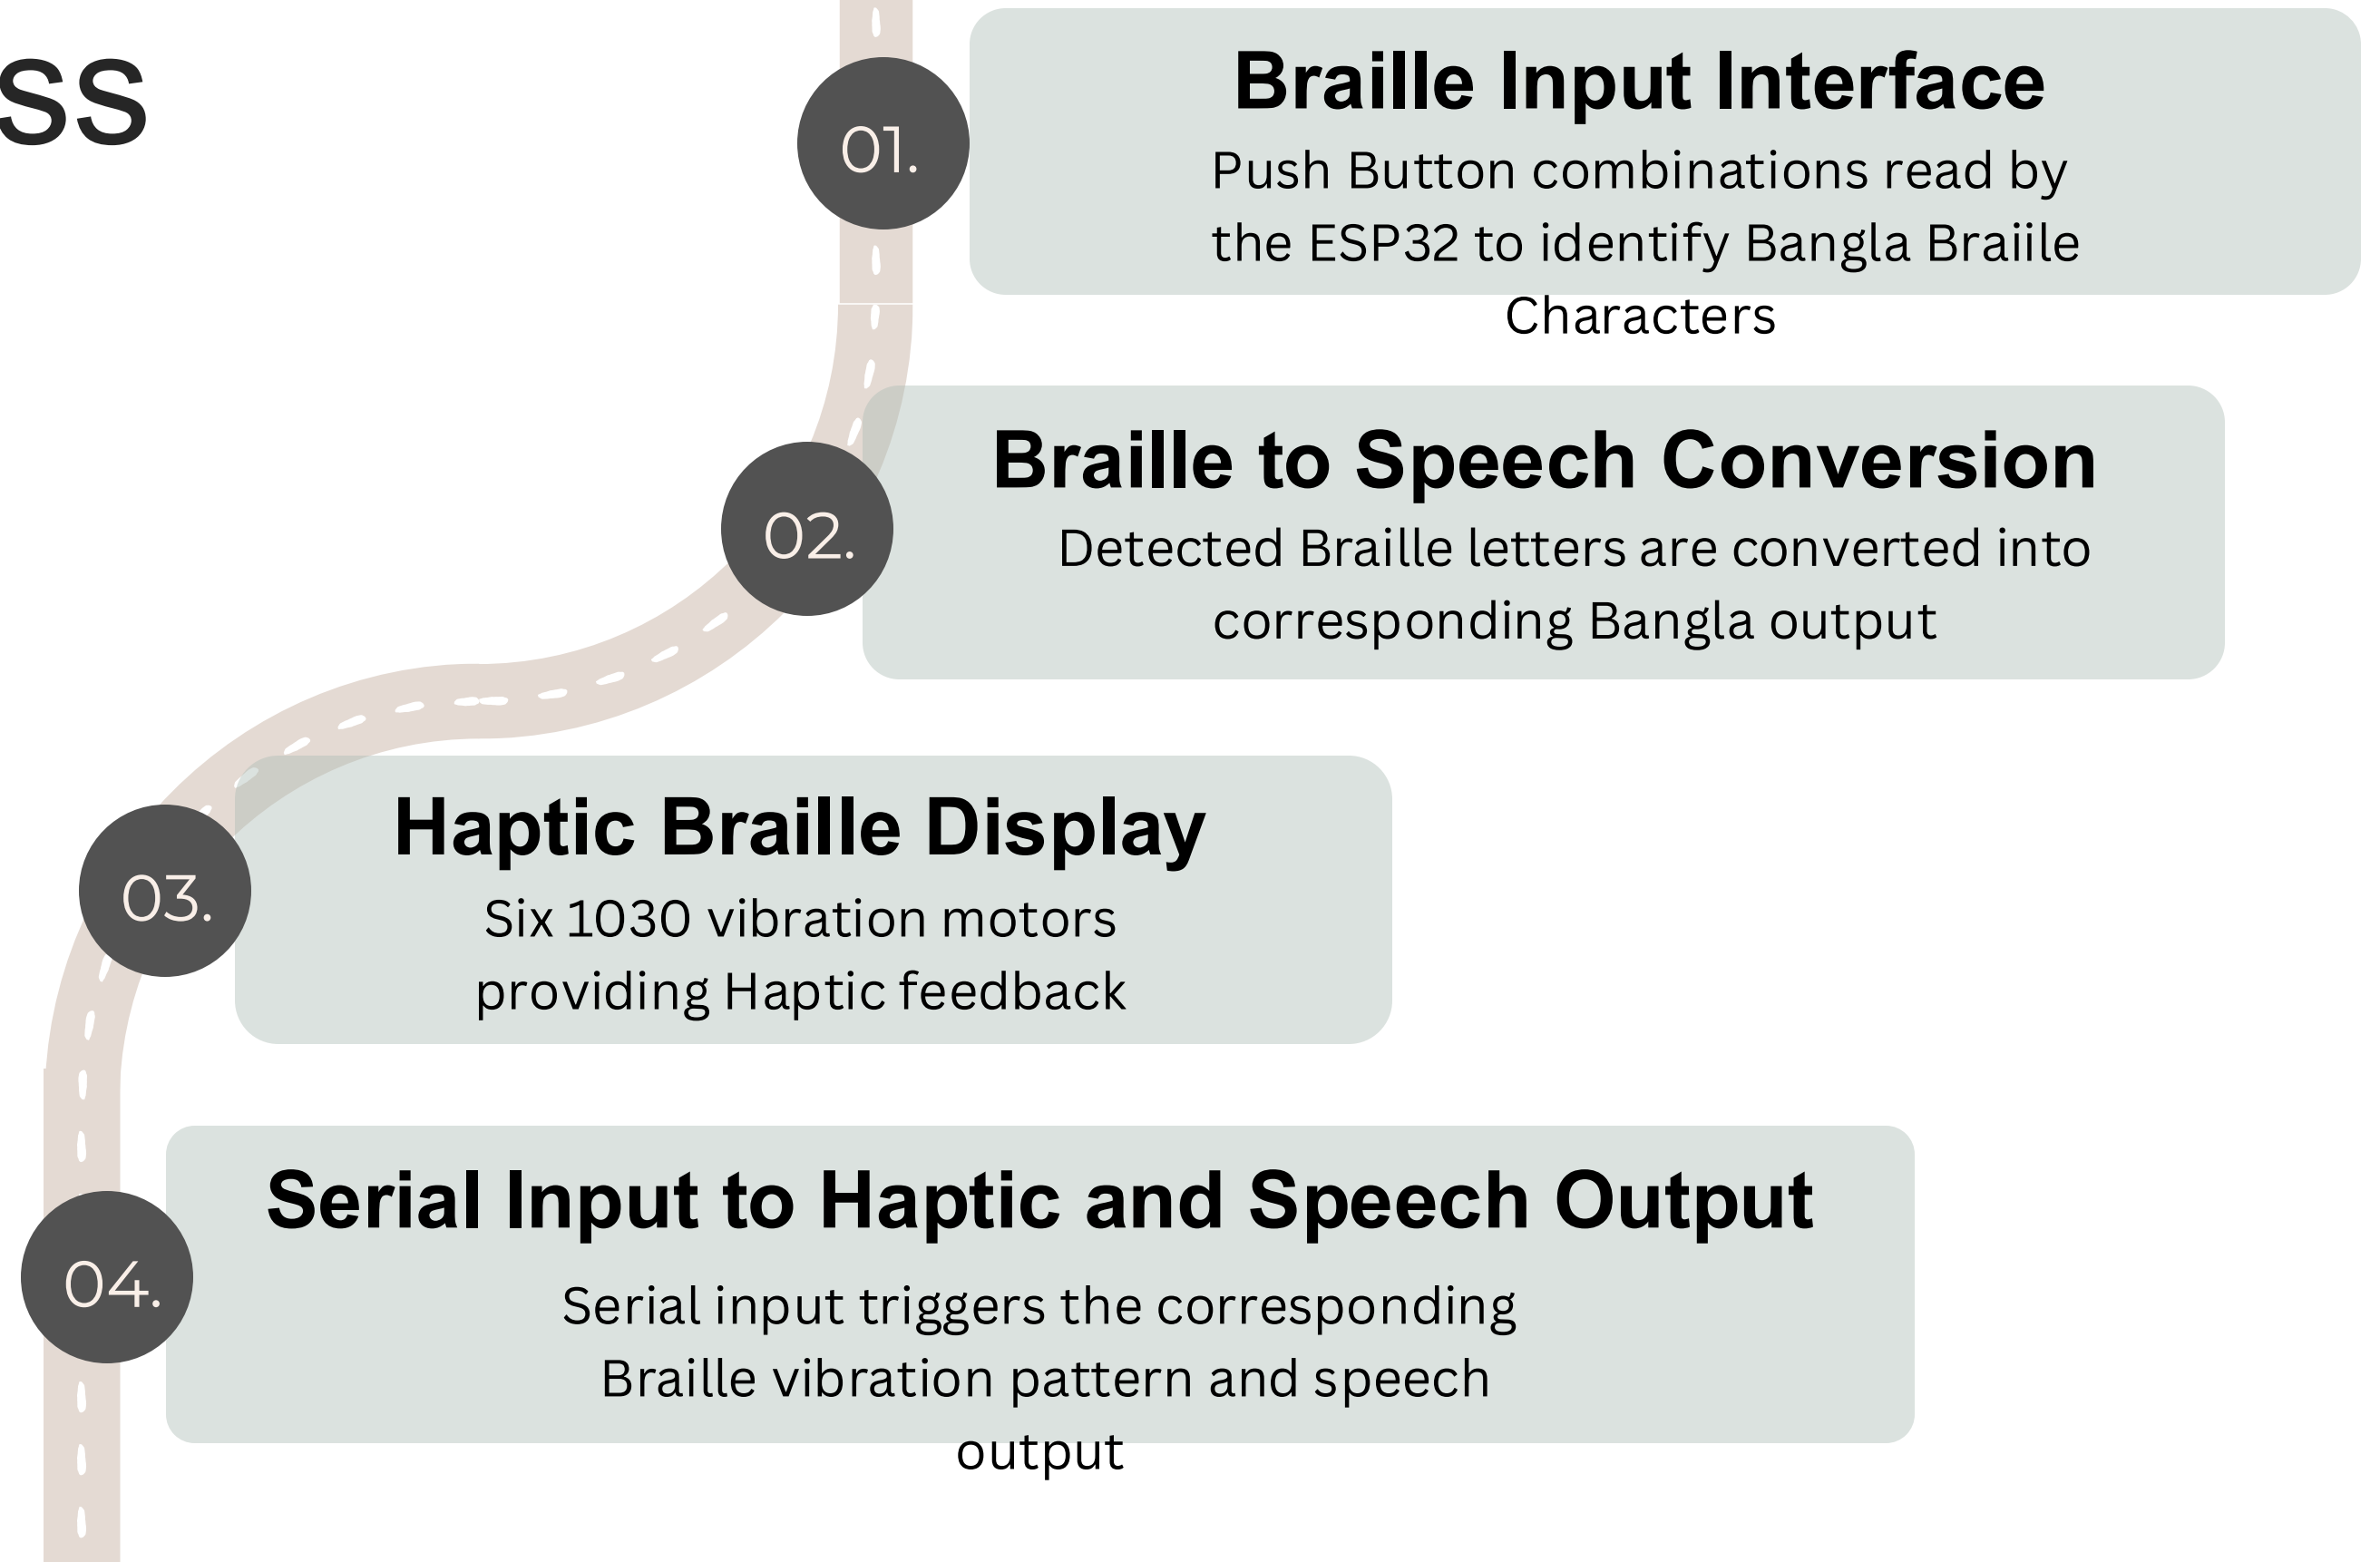

The learner enters a Braille character using the 6 dot button matrix. The ESP32 reads the input and records features.

ii. Data Processing & Logging:

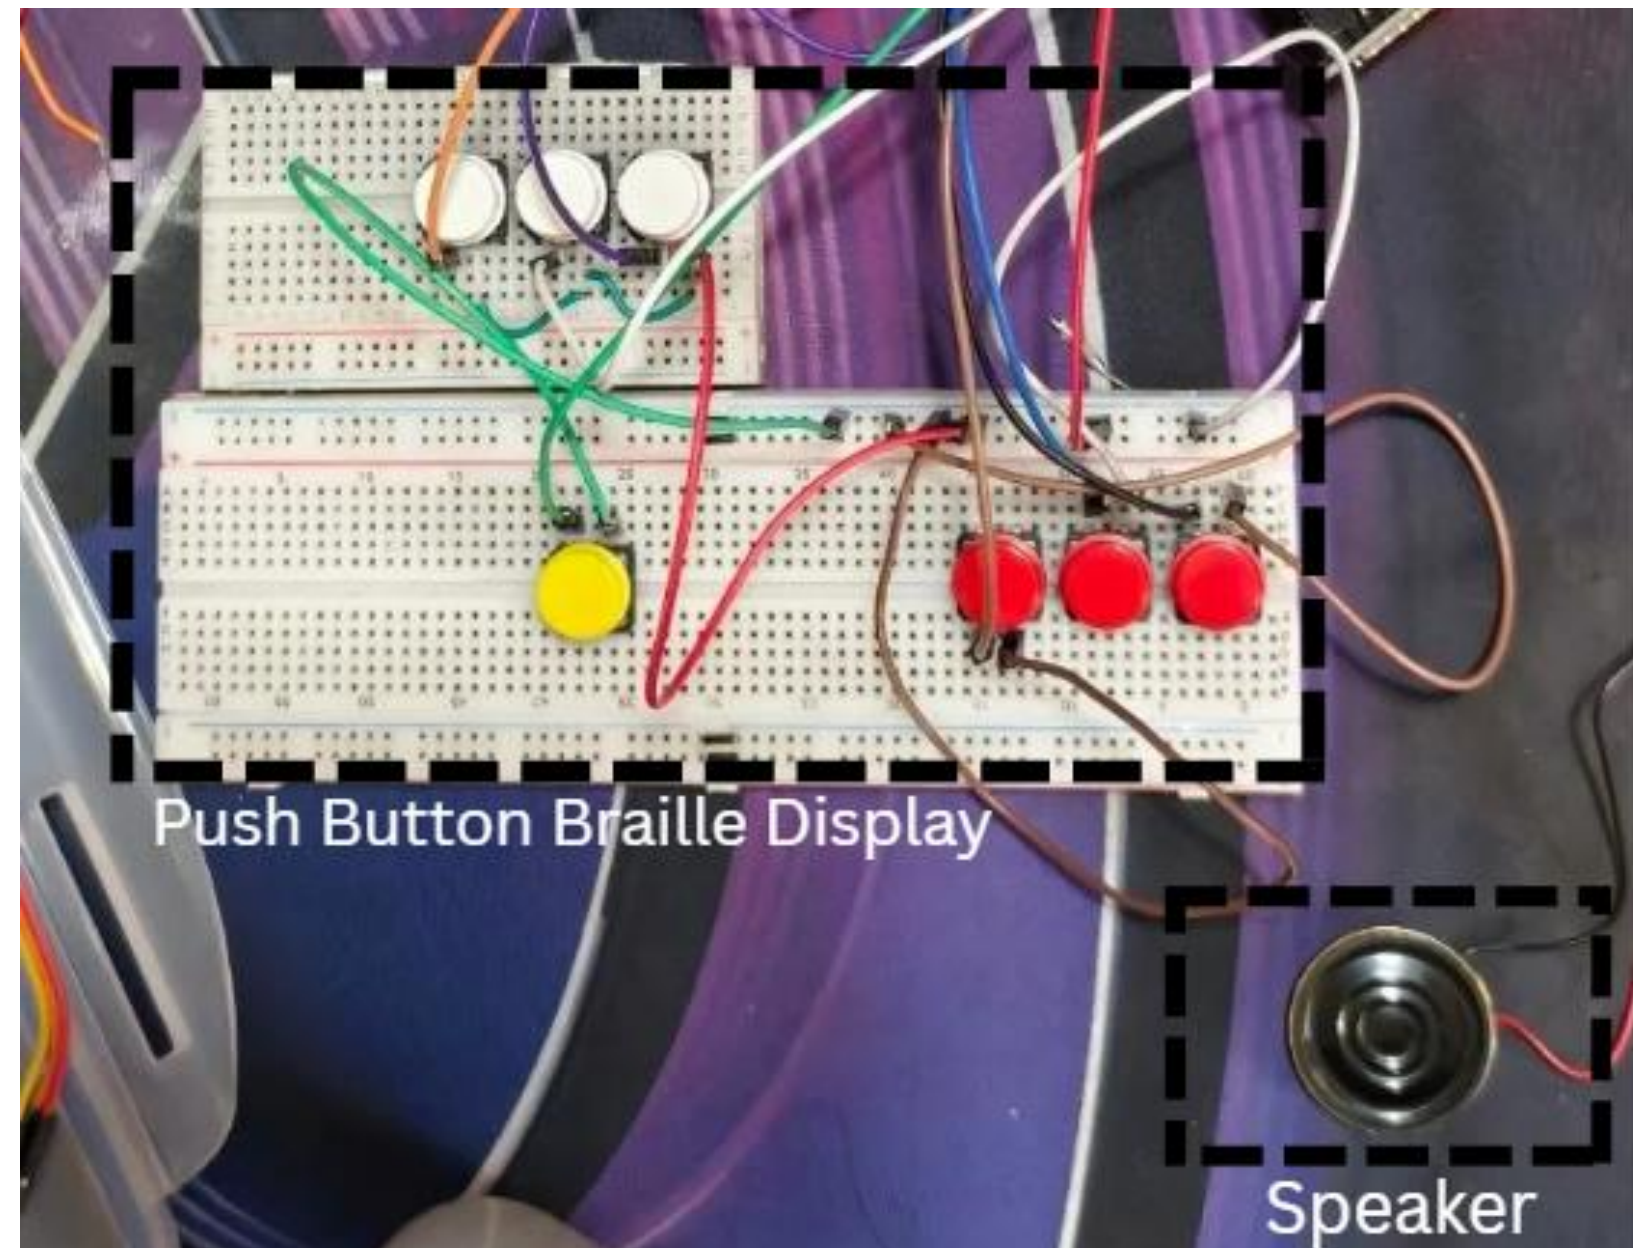

The ESP32 processes the 6-bit Braille pattern and stores the attempt result and collected features in a CSV file through the microSD module for further evaluation.

Weighted toward weaker characters. Produces the natural class distribution.

Normal practice Targeted — drive rare classes Review — weak characters only

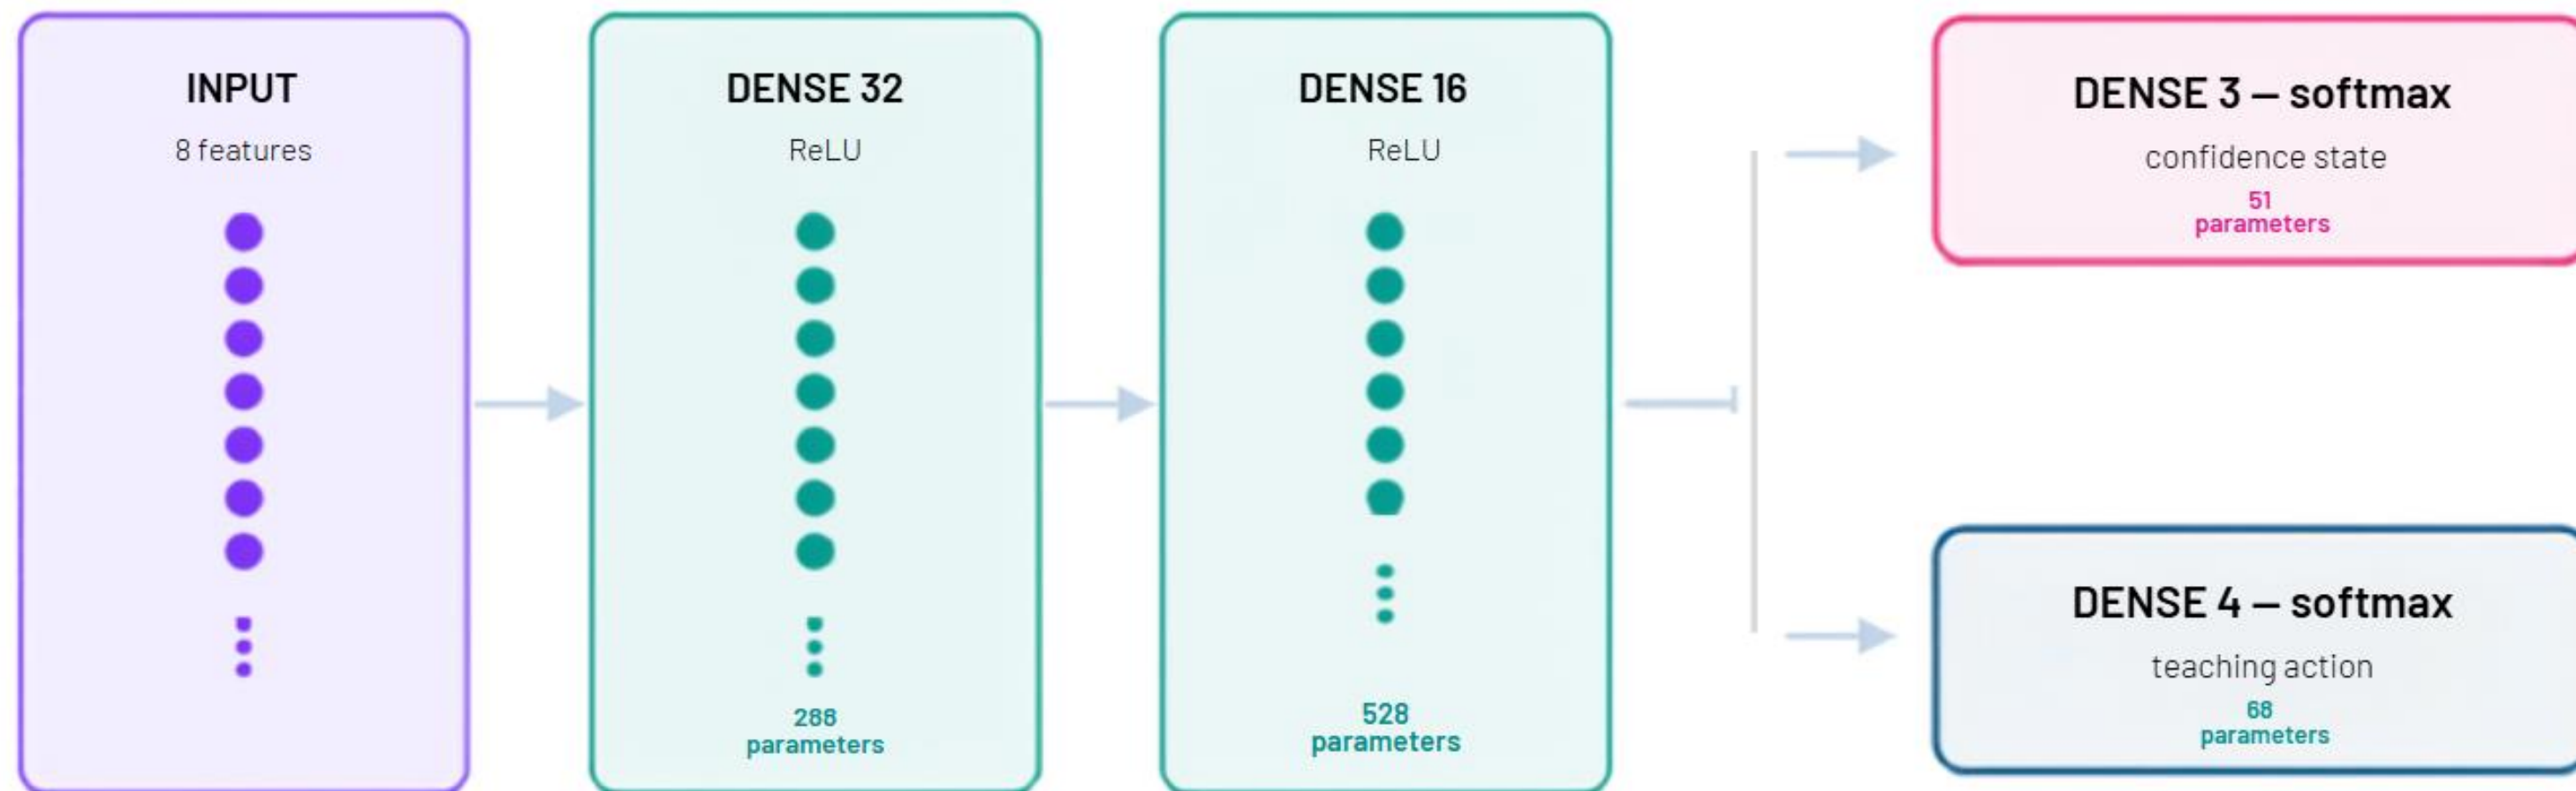

Web Platform for Practice and ML Data Collection

Remaining Task –1 : Testing Phase

- 1.Letter Sound:** The speaker plays the sound of a target letter.
- 2.User Response:** The user listens to the sound and presses the corresponding push button.
- 3.System Evaluation:** The system checks the selected button against the correct letter.
- 4.Feedback:** The result is provided through **vibration and/or speaker feedback**.
- 5.Learning Update:** The response is recorded for future learning and performance analysis.
